

SPARK Demo: Form to Brain Plan

Oct 5, 2026 · @C&C

Goal

For the SPARK demo at AI Everything, visitors get one licence offer page and a short form, then go straight into the Brain. We keep every person's details and their full Brain journey as one JSON file in a Supabase bucket. The Brain stays closed to anyone who did not fill the form.

- No email verification and no waiting. The visitor is inside the Brain within seconds.
- No new database. The Brain stays as it is; Supabase is the only storage.
- The application part (passports, Emirates ID, KYC) is hidden for this demo.
- Offer page text and email text come from the content team. We build with placeholder text.

What the visitor does

One screen leads to the next with nothing to wait for.

1. Scans the QR code at the stand.
2. Sees the one licence offer page and fills the form: name, email, phone. Taps Start.
3. Lands in the Brain straight away. Mira greets them.
4. Describes their business, picks activities, sees their package and price.
5. The journey ends at the summary. The application part is not shown.

What is saved

One JSON file per person in the Supabase bucket, named by their pass, for example `leads/PASS123.json`. The form creates it; every Brain step updates the same file. If they leave halfway, we keep everything up to that point.

Part	What it holds	Saved when
Contact	Name, email, phone, time, source (AI Everything)	Form submitted

Part	What it holds	Saved when
Description	What they typed about their business	After describe
Mira's replies	Follow-up questions, their answers, Mira's responses	After each follow-up
Activities	Activities shown and the ones they picked	After selection and confirm
Package and price	Shareholders, visas, premises, the price estimate	After the estimate
Progress	The last step they reached, last updated time	Every step

Not saved: passports, Emirates ID, KYC video or any application data.

Keeping the Brain closed

No form means no pass, and no pass means no Brain. The check runs on the Brain server, not only on the page, so nobody can skip the form by calling the Brain directly.

- **The pass is signed.** The Supabase function signs it with a secret key; the Brain checks the signature with the same key. No database lookup is needed.
- **It expires.** Each pass works for 24 hours.
- **It has limits.** A request limit per pass and per visitor, so nobody can run up the AI bill.
- **The team keeps its password.** brain.boasis.ae stays behind the current password. The demo uses one separate entrance that takes a pass instead.
- **Closing it after the demo** is one step: remove the demo entrance on the server.

Who does what

Claude writes the code and tests it locally; the developer sets up accounts and the server, because that needs access Claude does not have.

#	Task	Who	Where
1	Offer page and form, placeholder text, hidden from Google	Claude	Demo entrance

#	Task	Who	Where
2	Brain UI demo mode: read the pass, save after every step, hide the application	Claude	spark-brain-ui, new branch
3	Pass check on the Brain server	Claude writes, developer deploys	boasis-brain, new branch
4	Two Supabase functions: create pass and save step	Claude writes, developer deploys	Supabase
5	Server settings for the demo entrance, with request limits	Claude writes, developer installs	VPS, Nginx
6	Full test on a local machine, screenshots, handover note	Claude	Local
7	Create the Supabase project and a private bucket, set the secret keys	Developer	Supabase
8	DNS record for the demo entrance, SSL	Developer	Hostinger, VPS
9	Email sending account, if we send the optional email	Developer	Resend or similar
10	Approve each merge to main (merging deploys live)	Owner	GitHub
11	Offer page text and email text	Content team	
12	Close the demo entrance after the event	Developer	VPS

Not in this demo

- No database in the Brain. It still keeps sessions in memory.
- No accounts or logins for visitors.
- No application flow. It moves to its own branch later.
- No email in the visitor's path. An optional thank you email can go out afterwards, without blocking anything.
- No change to brain.boasis.ae for the team.

To confirm

- ☐ Developer and CTO agree with this flow and the split of work.
- ☐ Name of the demo entrance, for example spark.boasis.ae, or a path on brain.boasis.ae.
- ☐ Offer page lives on the demo entrance, not on boasis.ae (one place to close later).
- ☐ Supabase: new project or an existing Boasis one; bucket name.
- ☐ Pass lasts 24 hours. Is that right for the event?
- ☐ Optional thank you email: send it, or skip it for the demo.
- ☐ Time the developer can do the server and Supabase setup today.
